# 1. COMMUNICATION FUNCTIONS

## 1.1 General

- PXR provides a communication function by RS-485 interface, by which it can transmit and receive data to and from host computer, programmable controller, graphic display panel, etc.
- The communication system consists of master station and slave stations. Up to 31 slave stations (PXR) can be connected per master station.

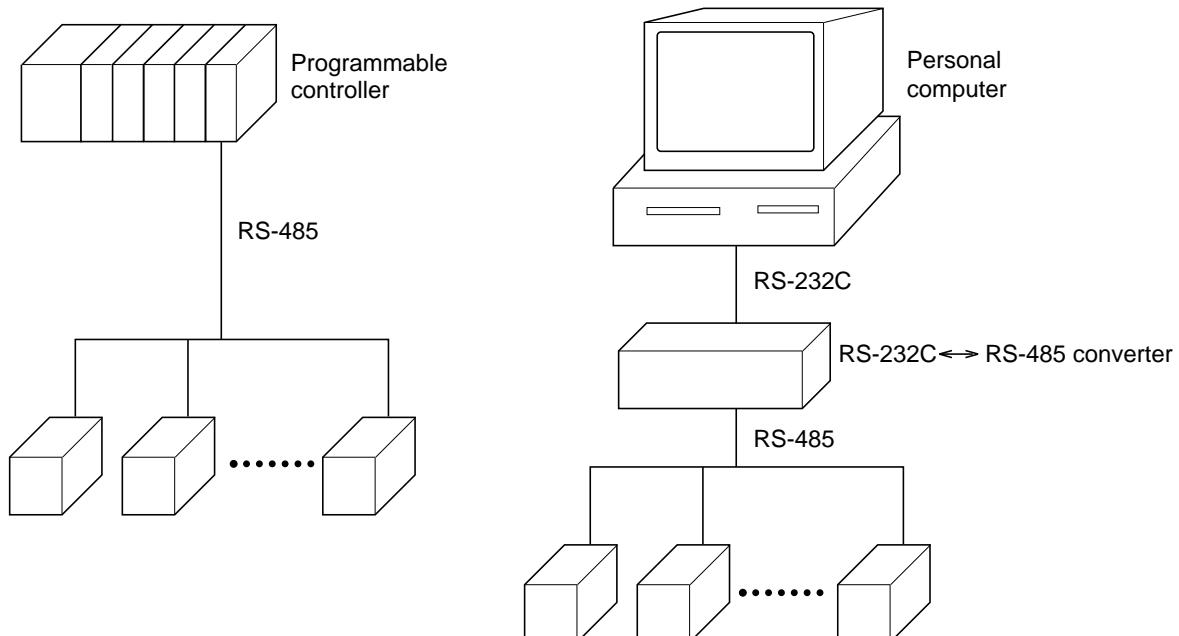

Note that, because the master station can communicate with only one slave station at a time, a party to communicate with must be specified by the "Station No." set at each slave station.

- In order that the master station and slave station can communicate, the format of the transmit/receive data must coincide. For the PXR, the format of the communication data is determined by the MODBUS protocol.
- Please use an RS-232C↔RS-485 converter in case of designating a personal computer or other devices which have an RS-232C interface as a master station.

[RS-232C↔RS-485 converter] (recommended article)

Type: KS-485 (non-isolated type)/SYSTEM SACOM Corp.

Type: SI-30A (isolated type)/SEKISUI ELECTRONICS Co., Ltd.

[Note] MODBUS® is the registered trade mark of Gould Modicon.

## 2. SPECIFICATIONS

### 2.1 Communication Specifications

| Item                     | Specification  |                              |
|--------------------------|--|------------------------------|
| Electrical specification | Based on EIA RS-485  |                              |
| Transmission system      | 2-wire, semi-duplicate   |                              |
| Synchronizing system     | Start-stop synchronous system  |                              |
| Connection format        | 1 : N  |                              |
| Number connectable units | Up to 31 units   |                              |
| Transmission distance    | 500m max. (total extension distance)   |                              |
| Transmission speed       | 9600bps  |                              |
| Data format              | Data length  | 8 bits                       |
|                          | Stop bit   | 1 bit                        |
|                          | Parity   | none, even, odd (selectable) |
| Transmission code        | HEX value (MODBUS RTU mode)  |                              |
| Error detection          | CRC-16   |                              |
| Isolation                | Functional isolation between transmission circuit and others (withstand voltage : 500V AC) |                              |

### 3. CONNECTION

#### WARNING

For avoiding electric shock and malfunctions, do not turn on the power supply until all wiring have been completed.

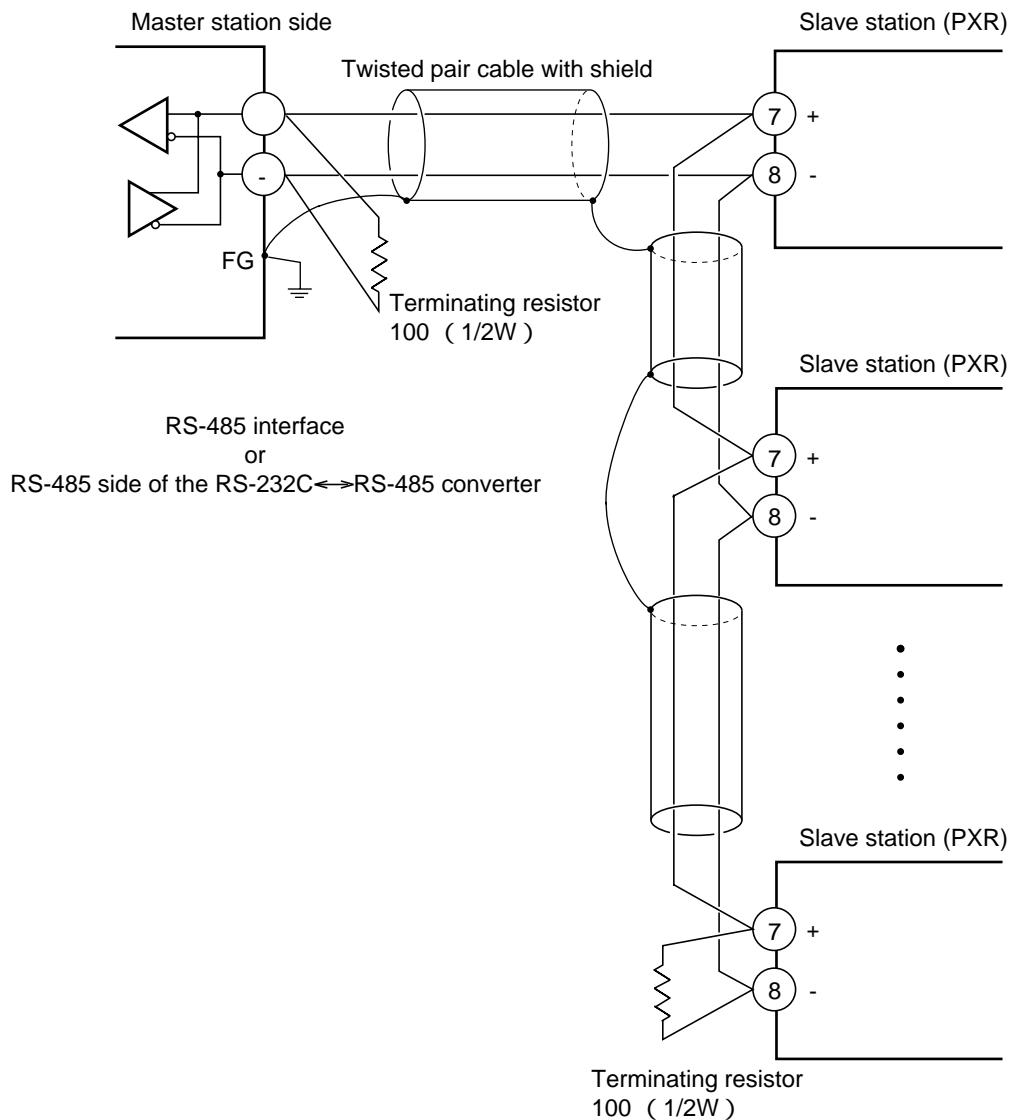

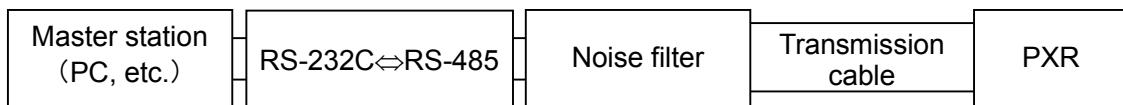

#### 3.1 Terminal Allocation

| Terminal number | Signal name |
|-----------------|-------------|
| 7               | +           |
| 8               | -           |

## 3.2 Wiring

- Use twisted pair cables with shield.  
Recommended cable: UL2464, UL2448, etc.
- The total extension length of the cable is up to 500 m. A master station and up to 31 units of the PXR can be connected per line.
- Both ends of the cable should be terminate with terminating resistors  $100\Omega$  1/2W.
- The shield wire of the cable should be grounded at one place on the master station unit side.
- If the PXR is to be installed where the level of noise applied to the PXR may exceed 1000 V, it is recommended to install a noise filter in the master station side as below.

Recommended noise filter: ZRAC2203-11/TDK

# 4. SETTING OF COMMUNICATION CONDITION

In order that the master station and instrument (PXR) can correctly communicate, following settings are required.

- All communication condition settings of the master station are the same as those of instruments (PXR).
- All instruments (PXR) connected on a line are set to "Station Nos. (STno)" which are different from each other.  
(Any "Station No." is not shared by more than one instrument.)

## 4.1 Set Items

The parameters to be set are shown in the following table. Set them by operating the front panel keys.

| Parameter symbol | Item               | Value at delivery | Setting range                                     | Remarks  |
|------------------|--------------------|-------------------|---|--|
| _____            | Transmission speed | 9600bps           | Fixed (can not be changed)                        | Set the same communication condition to the master station and all slave stations. |
| _____            | Data length        | 8 bits            | Fixed (can not be changed)                        |  |
| _____            | Stop bit           | 1 bit             | Fixed (can not be changed)                        |  |
| CoM              | Parity setting     | 0                 | 0: odd parity<br>1: even parity<br>2: none parity |  |
| STno             | Station No.        | 1                 | 0 to 255<br>(0:communication function stop)       | Set a different value to each station.   |

## 4.2 Setting Operation Method

The following example shows how to set the communication conditions.

Example: Selecting an even parity and “STno=18” on a station.

| Key operation      | Indication | Description   |
|--------------------|------------|---|
|                    | 200<br>200 | Running state (PV/SV indication)  |
| SEL<br>(6 seconds) | P-n1<br>0  | Press the SEL key for approximately 6 seconds. P-n1 appears and No. 3 block parameter is selected.      |
| ▼                  | STno<br>0  | Operate the ▼ key repeatedly until STno parameter appears. (If past over, operate the ▲ key to return.) |
| SEL                | STno<br>0  | Press the SEL key. The numeric value on the lower indicator blinks and the setting mode is selected.    |
| ▲▼                 | STno<br>18 | Operate the ▲ or ▼ key to change the numeric value to 18.   |
| SEL                | STno<br>18 | Press the SEL key again. The numeric value stops blinking and the setting is registered.                |
| ▼                  | CoM<br>0   | Press the ▼ key to display the CoM parameter.   |
| SEL                | CoM<br>0   | Press the SEL key. The numeric value on the lower indicator blinks and the setting mode is selected.    |
| ▲▼                 | CoM<br>1   | Operate the ▲ or ▼ key until the numeric value changes to 1 (even parity).                              |
| SEL                | CoM<br>1   | Press the SEL key again. The numeric value stops blinking and the setting is registered.                |
| SEL<br>(3 seconds) | 200<br>200 | Press the SEL key for 3 seconds to resume the running indication (PV/SV indication).                    |

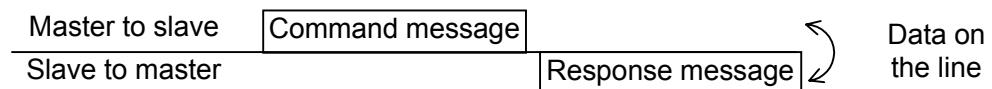

# 5. MODBUS COMMUNICATION PROTOCOL

## 5.1 General

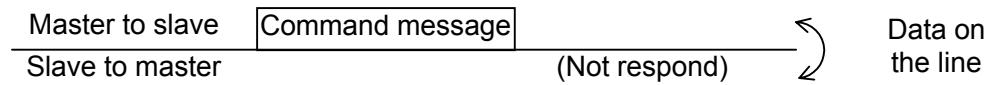

The communication system by the MODBUS protocol is that the communication is always started from the master station and a slave station responds to the received message.

Transmission procedures is as shown below.

- 1) The master station sends a command message to a slave station.
  - 2) The slave station checks that the station No. in the received message matches with the own station No. or not.
  - 3) If matched, the slave station executes the command and sends back the response message.
  - 4) If mismatched, the slave station leaves the command message and wait for the next command message.
- a) In case when the station No. in the received command message matches with the own slave station No.

- b) In case when the station No. in the received command message mismatches with the own slave station No.

The master station can individually communicate with any one of slave stations connected on the same line upon setting the station No. in the command message.

## 5.2 Composition of Message

Command message and response message consist of 4 fields ; Station No., Function code, Data and Error check code. And these are send in this order.

|                                     |
|-------------------------------------|
| Station No. (1 byte)                |
| Function code (1 byte)              |
| Data (2 to 125 bytes)               |
| Error check code (CRC-16) (2 bytes) |

Fig. 5-1 Composition of message

In the following, each field is explained.

### (1) Station No.

Station No. is the number specifying a slave station. The command message is received and operated only by the slave station whose station No. matches with the No. set in the parameter "STno".

For details of setting the parameter "STno", refer to chapter 4.

### (2) Function code

This is a code to designate the function executed at a slave station.

For details, refer to section 5.4.

### (3) Data

Data are the data required for executing function codes. The composition of data varies with function codes. For details, refer to chapter 6.

A coil number or a register number is assigned to each data in the temperature controller. For reading/writing the data by communication, designate the coil number or register number.

Note that the coil number or register number transmitted on message is expressed as its relative address. The relative address is calculated by the following expression.

$$\boxed{\text{Relative address}} = \left( \text{The lower 4 digits of the } \boxed{\text{Coil number or register number}} \right) - 1$$

For example, when the register number designated by a function code is 40003,

$$\begin{aligned} \text{Relative address} &= (\text{lower 4 digits of 40003}) - 1 \\ &= 0002 \end{aligned}$$

is used on the message.

#### (4) Error check code

This is the code to detect message errors (change in bit) in the signal transmission.

On the MODUBUS protocol (RTU mode), CRC-16 (Cyclic Redundancy Check) is applied.

For CRC calculation method, refer to section 5.5.

## 5.3 Response of Slave Station

### (1) Response for normal command

To a relevant message, the slave station creates and sends back a response message which corresponds to the command message. The composition of message in this case is the same as in section 5.2.

Contents of the data field depend on the function code. For details, refer to Chapter 6.

### (2) Response for abnormal command

If contents of a command message have an abnormality (for example, non-actual function code is designated) other than transmission error, the slave station does not execute that command but creates and sends back a response message at error detection.

The composition of response message at error detection is as shown in Fig. 5-2 The value used for function code field is function code of command message plus  $80_{\text{H}}$ .

Table 5-1 gives error codes.

|                                 |
|---------------------------------|
| Station No.                     |
| Function code + $80_{\text{H}}$ |
| Error code                      |
| Error check (CRC-16)            |

Fig. 5-2 Response message at error detection

Table 5-1 Error code

| Error code | Contents             | Description  |
|------------|----------------------|--|
| 01H        | Illegal function     | Non-actual function code is designated.<br>Check for the function code.  |
| 02H        | Illegal data address | A relative address of a coil number or register number to which the designated function code can not be used.              |
| 03H        | Illegal data value   | Because the designation of number is too much, the area where coil numbers or register numbers do not exist is designated. |

### (3) No response

Under any of the following items, the slave station takes no action of the command message and sends back no response.

- A station number transmitted in the command message differs from the station number specified to the slave station.
- A error check code is not matched, or a transmission error (parity error, etc.) is detected.
- The time interval between the composition data of the message becomes longer than the time corresponding to 24 bits. (Refer to section 5.6 Transmission Control Procedure)
- While the data is being written in non-volatile memory after write via communication, the next write is attempted.

## 5.4 Function Code

According to MODBUS protocol, coil numbers and register numbers are assigned by function codes.

Each function code acts on specific coil number and register number.

This correspondence is shown in Table 5-2, and the message length by function is shown in Table 5-3.

Table 5-2 Correspondence between function codes and objective address

| Function code   |                            |                  | Coil No. and resister No. |                             |
|-----------------|----------------------------|------------------|---------------------------|-----------------------------|
| No.             | Function                   | Object           | No.                       | Contents                    |
| 01 <sub>H</sub> | Read-out<br>(continuously) | Coil             | 0xxxx                     | Read-out/write-in bit data  |
| 02 <sub>H</sub> | Read-out<br>(continuously) | Input relay      | 1xxxx                     | Read-out bit data           |
| 03 <sub>H</sub> | Read-out<br>(continuously) | Holding register | 4xxxx                     | Read-out/write-in word data |
| 04 <sub>H</sub> | Read-out<br>(continuously) | Input register   | 3xxxx                     | Read-out word data          |
| 05 <sub>H</sub> | Write-in                   | Coil             | 0xxxx                     | Read-out/write-in bit data  |
| 06 <sub>H</sub> | Write-in                   | Holding register | 4xxxx                     | Read-out/write-in word data |
| 10 <sub>H</sub> | Write-in<br>(continuously) | Holding register | 4xxxx                     | Read-out/write-in word data |

Table 5-3 Function code and message length

| Function code   | Contents                                 | Number of designatable data | Command message |         | Response message |         | [Unit:byte] |
|-----------------|--|-----------------------------|-----------------|---------|------------------|---------|-------------|
|                 |  |                             | Minimum         | Maximum | Minimum          | Maximum |             |
| 01 <sub>H</sub> | Read-out of bit data                     | 1bit <sup>*1</sup>          | 8               | 8       | 6                | 6       |             |
| 02 <sub>H</sub> | Read-out of bit data (read-out only)     | 8 bits <sup>*1</sup>        | 8               | 8       | 6                | 6       |             |
| 03 <sub>H</sub> | Read-out of word data                    | 60 words <sup>*1</sup>      | 8               | 8       | 7                | 125     |             |
| 04 <sub>H</sub> | Read-out of word data<br>(read-out only) | 15 words <sup>*1</sup>      | 8               | 8       | 7                | 35      |             |
| 05 <sub>H</sub> | Write-in of bit data                     | 1 bit                       | 8               | 8       | 8                | 8       |             |
| 06 <sub>H</sub> | Write-in of word data                    | 1 word                      | 8               | 8       | 8                | 8       |             |
| 10 <sub>H</sub> | Write-in of continuous word data         | 60 words <sup>*1</sup>      | 11              | 129     | 8                | 8       |             |

\*1) The "Number of designatable data" given above is the limit due to the number of data which the instrument assigns to coil number and register number (except function codes 05<sub>H</sub>, 06<sub>H</sub>).

## 5.5 Calculation of Error Check Code (CRC-16)

CRC-16 is the 2-byte (16-bits) error check code. From the top of the message (station No.) to the end of the data field are calculated.

The slave station calculates the CRC of the received message, and does not respond if the calculated CRC is different from the contents of the received CRC code.

Fig. 5-3 shows the flow of the CRC-16 calculation system.

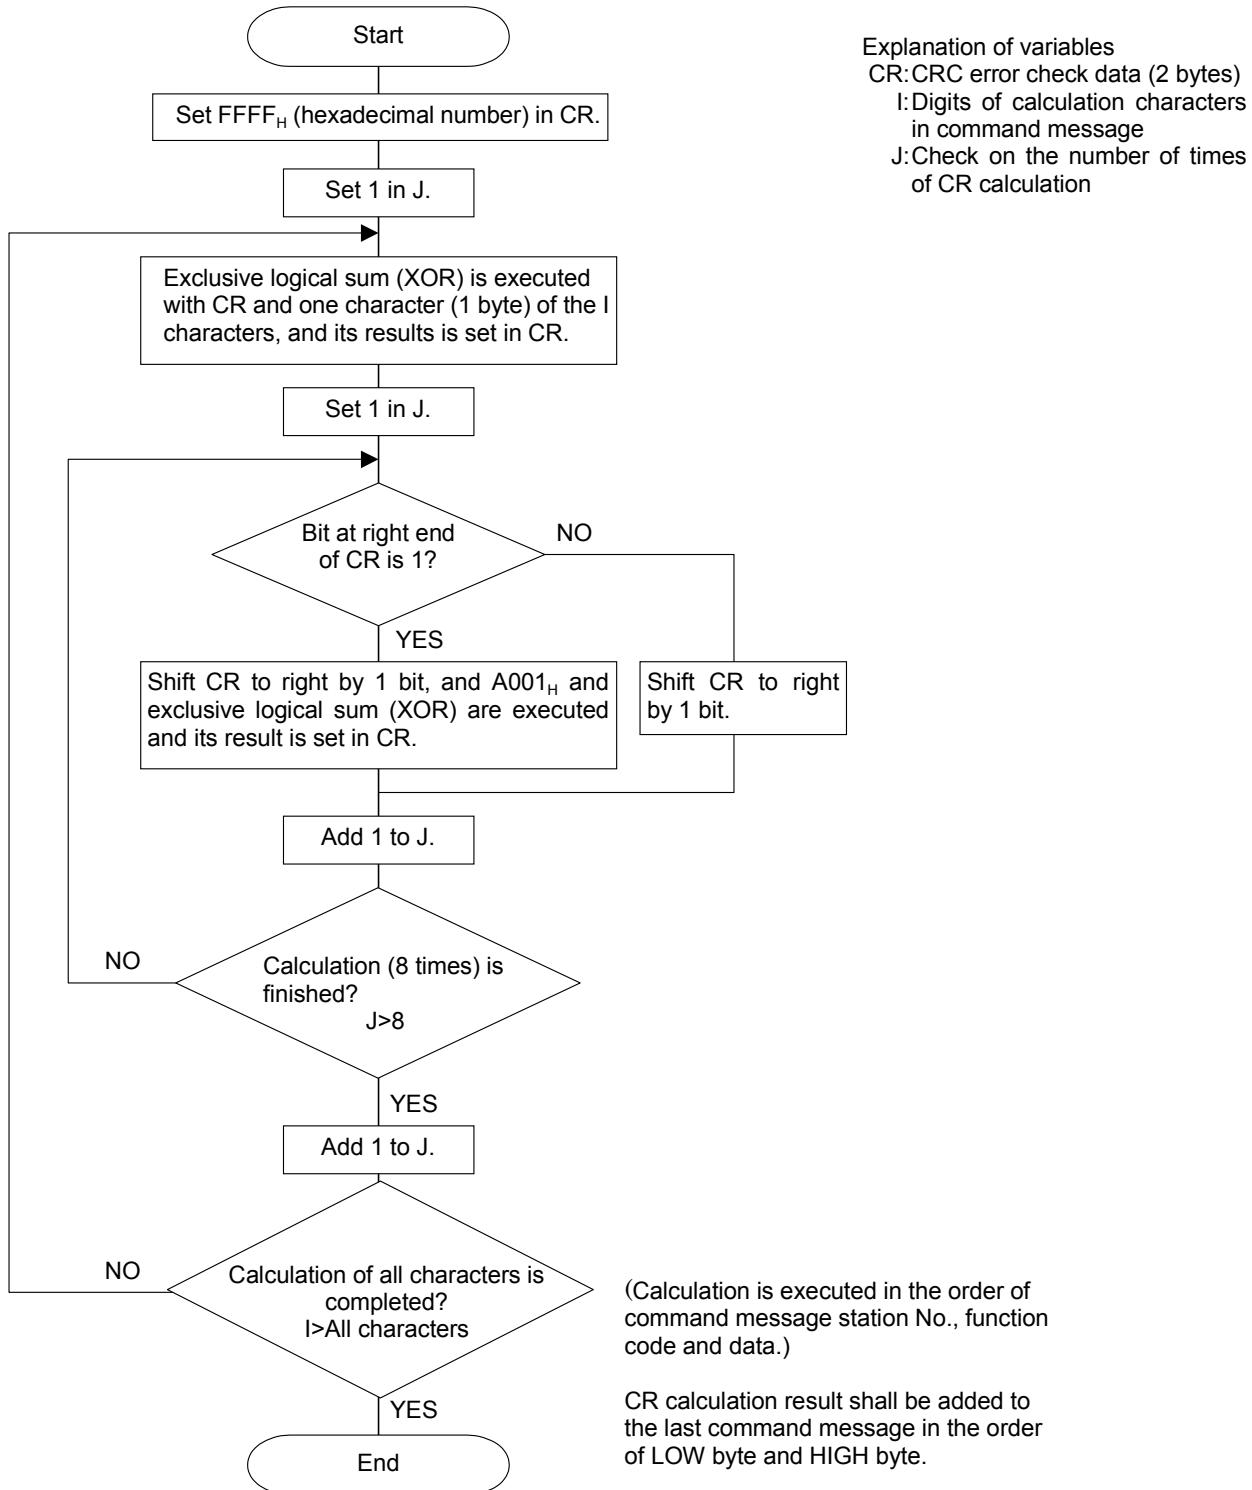

Fig. 5-3 Flow of CRC-16 calculation

## 5.6 Transmission Control Procedure

### (1) Transmission procedure of master station

The master station must proceed to a communication upon conforming to the following items.

- (1-1) Before sending a command message, provide 48 bits time or more vacant status.
- (1-2) For sending, the interval between bytes of a command message is below 24 bits time.
- (1-3) Within 24 bits time after sending a command message, the receiving status is posted.
- (1-4) Provide 48 bits time or more vacant status between the end of response message reception and beginning of next command message sending [same as in (1-1)].
- (1-5) For ensuring the safety, make a confirmation of the response message and make an arrangement so as to provide 3 or more retries in case of no response, error occurrence, etc.

Note) The above definition is for most unfavorable value. For ensuring the safety, it's recommended the program of the master to work with safety factors of 2 to 3. Concretely, it is advised to arrange the program for 9600 bps with 10 ms or more for vacant status (1-1), and within 1 ms for byte interval (1-2) and changeover from sending to receiving (1-3).

### (2) Description

#### 1) Detection of the message frame

Since the communication system uses the 2-wire RS-485 interface, there may be 2 statuses on a line below.

- (a) Vacant status (no data on line)
- (b) Communication status (data is existing)

Instruments connected on the line are initially at a receiving status and monitoring the line. When 24 bits time or more vacant status has appeared on the line, the end of preceding frame is assumed and, within following 24 bits time, a receiving status is posted. When data appears on the line, instruments receive it while 24 bits time or more vacant status is detected again, and the end of that frame is assumed. I.e., data which appeared on the line from the first 24 bits time or more vacant status to the next 24 bits time or more vacant status is fetched as one frame.

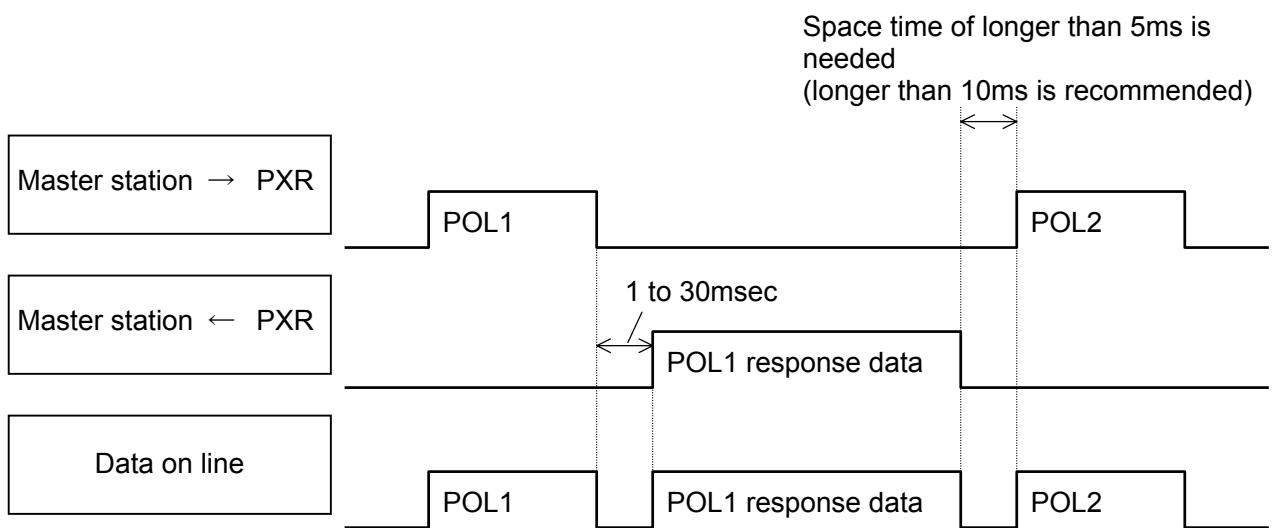

Therefore, one frame (command message) must be sent upon confirming the following.

- (1-1) 48 bits time or more vacant status precedes the command message sending.
- (1-2) Interval between bytes of 1 command message is smaller than 24 bits time.

#### 2) Response of this instrument (PXR)

After a frame detection (24 bits time or more vacant status), this instrument carries out processing with that frame as a command message. If the command message is destined to the own station, a response message is returned. Its processing time is 1 to 30 ms (depends on contents of command message). After sending a command message, therefore, the master station must observe the following.

- (1-3) Receiving status is posted within 24 bits time after sending a command message.

## 5.7 FIX Processing (Cautions at write-in of data)

The instrument is provided inside with a non-volatile memory (EEPROM) for holding the setting parameters. Data written in the non-volatile memory is not lost even if turning off the power. When setting parameter is written via communication, the data is stored in the internal memory (RAM) and then written in the non-volatile memory.

FIX execution writes the parameters stored in the internal memory into the non-volatile memory, but this function is not required any more because the data is written in non-volatile memory when it is written in the parameter.

Fig. 5-4 shows the FIX procedure.

### Cautions:

- Write in the non-volatile memory takes approximately 5 seconds at the longest approximately 5 seconds.
- While writing, do not turn off the power of the PXR. Otherwise, the data in the non-volatile memory will be destroyed, whereby the PXR could not be used any longer.
- The non-volatile memory (EEPROM) is a device where the number of write-in times is limited. The guaranteed number of write-in times of the non-volatile memory used on the instrument is 10,000 minimum. Therefore, limit the times of change of parameter setting to absolute minimum. Refrain from carrying out the FIX processing periodically for example or while such is not absolutely required.

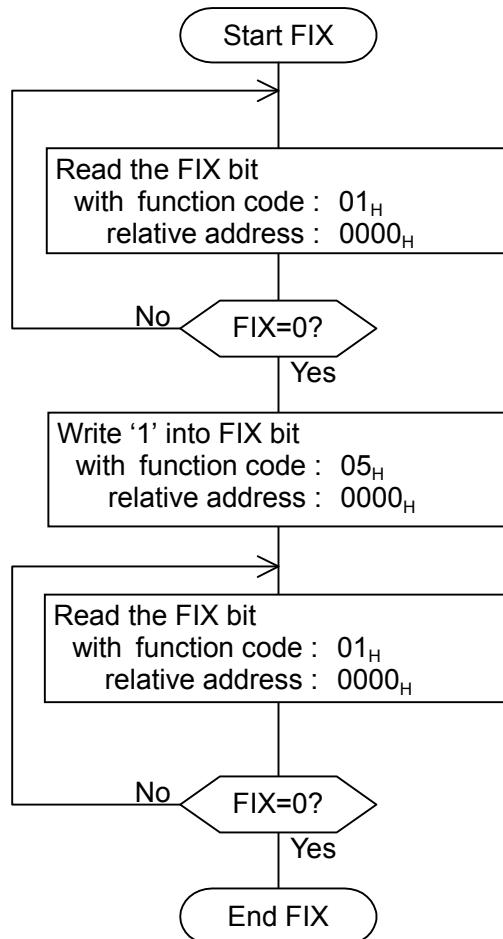

Fig. 5-4 FIX procedure

# 6. DETAILS OF MESSAGE

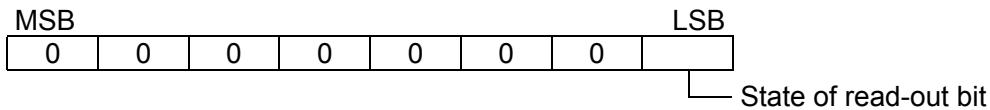

## 6.1 Read-out of Bit Data [Function code:01<sub>H</sub>]

| Function code   | Max. bit number read-out in one message | Relative data address | Coil number |
|-----------------|---|-----------------------|-------------|
| 01 <sub>H</sub> | 1 bit                                   | 0000 <sub>H</sub>     | 00001       |

### (1) Message composition

| Command message composition (byte)       |                                    | Response message composition (byte) |                |
|--|------------------------------------|-------------------------------------|----------------|
| Station No.                              |                                    | Station No.                         |                |
| Function code                            |                                    | Function code                       |                |
| Read-out start No.<br>(relative address) | 00 <sub>H</sub><br>00 <sub>H</sub> | 01 <sub>H</sub>                     |                |
| Read-out bit number                      | 00 <sub>H</sub><br>01 <sub>H</sub> | State of the first 8 bits           |                |
| CRC data                                 | Upper<br>Lower                     | CRC data                            | Upper<br>Lower |

\* Arrangement of read-out bit data

### (2) Function explanations

The state of the bit of the coil No. 00001 is read-out.

### (3) Message transmission (example)

The following shows an example of reading-out the FIX execution request data from No. 1 slave station.

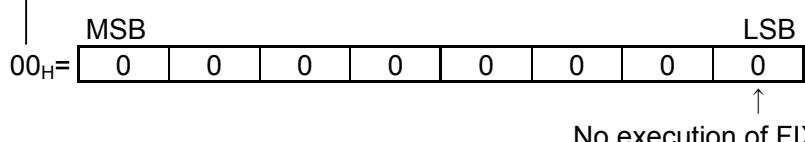

FIX execution request bit    Relative address : 0000<sub>H</sub>    Number of data : 01<sub>H</sub>

| Command message composition (byte)       |                 |                                    |
|--|-----------------|------------------------------------|
| Station No..                             | 01 <sub>H</sub> |                                    |
| Function code                            | 01 <sub>H</sub> |                                    |
| Read-out start No.<br>(relative address) | Upper<br>Lower  | 00 <sub>H</sub><br>00 <sub>H</sub> |
| Read-out<br>bit number                   | Upper<br>Lower  | 00 <sub>H</sub><br>01 <sub>H</sub> |
| CRC data                                 | Upper<br>Lower  | FD <sub>H</sub><br>CA <sub>H</sub> |

| Response message composition (byte) |                 |                                    |
|-------------------------------------|-----------------|------------------------------------|
| Station No.                         | 01 <sub>H</sub> |                                    |
| Function code                       | 01 <sub>H</sub> |                                    |
| Read-out byte number                | 01 <sub>H</sub> |                                    |
| State of the first 8 bits           | 00 <sub>H</sub> |                                    |
| CRC data                            | Upper<br>Lower  | 51 <sub>H</sub><br>88 <sub>H</sub> |

\* Meaning of read data

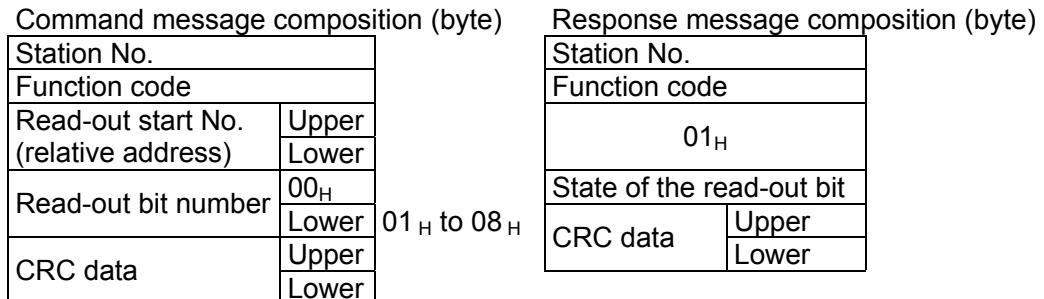

State of FIX execution request

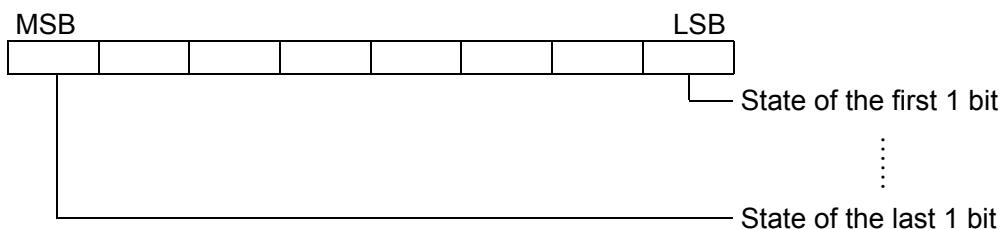

## 6.2 Read-out of Read-out Only Bit Data [Function code:02<sub>H</sub>]

| Function code   | Max. bit number read-out in one message | Relative data address                | Coil number |
|-----------------|---|--------------------------------------|-------------|
| 02 <sub>H</sub> | 8 bits                                  | 0000 <sub>H</sub> –000F <sub>H</sub> | 10001–10016 |

### (1) Message composition

\* Arrangement of read-out bit data

### (2) Function explanations

Bit information data of continuous read-out bit number from the read-out start number.

Read-out bit data are arranged in 8-bit unit and transmitted from the slave station.

When read-out bit data number is not multiple of 8, all the bits (MSB side) not related with the state of the last 8 bits will become "0".

### (3) Message transmission (example)

The following shows an example of reading-out the state of the alarm 1 and alarm 2 transmitted from No.31 slave station.

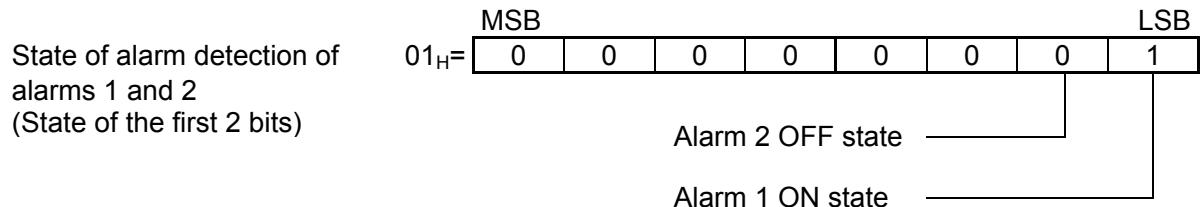

Alarm 1 detect data bit    Relative address : 000C<sub>H</sub>    Data number : 02<sub>H</sub>

Alarm 2 detect data bit    Relative address : 000D<sub>H</sub>

| Command message composition (byte)       |                          |                 |
|--|--------------------------|-----------------|
| Station No.                              | 1F <sub>H</sub>          |                 |
| Function code                            | 02 <sub>H</sub>          |                 |
| Read-out start No.<br>(relative address) | Upper<br>00 <sub>H</sub> | 00 <sub>H</sub> |

|  | Lower<br>76 <sub>H</sub> | 76 <sub>H</sub> |

| Response message composition (byte) |                          |                 |
|-------------------------------------|--------------------------|-----------------|
| Station No.                         | 1F <sub>H</sub>          | 1F <sub>H</sub> |
| Function code                       | 02 <sub>H</sub>          | 02 <sub>H</sub> |
| Read-out byte number                | 01 <sub>H</sub>          | 01 <sub>H</sub> |
| State of the first 8 bits           | 01 <sub>H</sub>          | 01 <sub>H</sub> |
| CRC data                            | Upper<br>66 <sub>H</sub> | 66 <sub>H</sub> |
|                                     | Lower<br>60 <sub>H</sub> | 60 <sub>H</sub> |

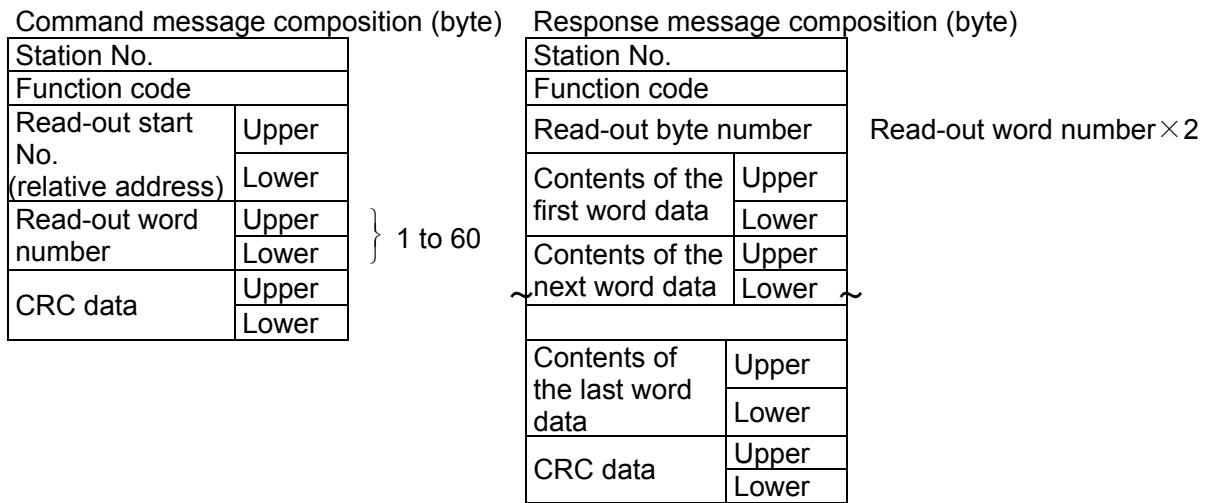

\* Meaning of read-out data

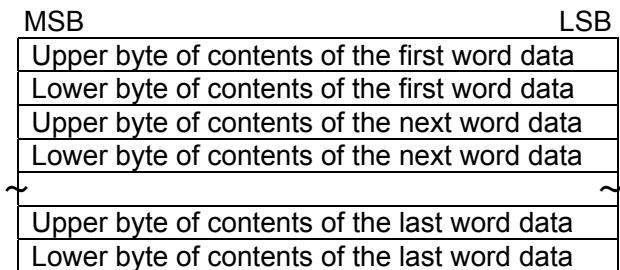

## 6.3 Read-out of Word Data [Function code:03<sub>H</sub>]

| Function code   | Max. word number read-out in one message | Relative data address                | Resister No. | Kind of data               |
|-----------------|--|--------------------------------------|--------------|----------------------------|
| 03 <sub>H</sub> | 60 words                                 | 0000 <sub>H</sub> —0070 <sub>H</sub> | 40001—40113  | Internal calculation value |
|                 |  | 03E8 <sub>H</sub> —0458 <sub>H</sub> | 41001—41113  | Engineering unit           |

### (1) Message composition

\* Arrangement of read-out word data

### (2) Function explanations

Word data of continuous word numbers from the read-out start No. can be read. Read-out word data are transmitted from the slave station in the order of upper and lower bytes.

### (3) Message transmission

#### (a) In case of data of internal calculation value

The following shows an example of reading the low and high limits of set value from No. 2 slave station.

Relative address of low limit of set value : 001E<sub>H</sub>      Data number : 02<sub>H</sub>

Command message composition (byte)

|  |                 |                 |
|--|-----------------|-----------------|
| Station No.                              | 02 <sub>H</sub> |                 |
| Function code                            | 03 <sub>H</sub> |                 |
| Read-out start No.<br>(relative address) | Upper           | 00 <sub>H</sub> |
|  | Lower           | 1E <sub>H</sub> |
| Read-out word<br>number                  | Upper           | 00 <sub>H</sub> |
|  | Lower           | 02 <sub>H</sub> |
| CRC data                                 | Upper           | A4 <sub>H</sub> |
|  | Lower           | 3E <sub>H</sub> |

Response message composition (byte)

|                                    |                 |                 |
|------------------------------------|-----------------|-----------------|
| Station No.                        | 02 <sub>H</sub> |                 |
| Function code                      | 03 <sub>H</sub> |                 |
| Read-out byte number               | 04 <sub>H</sub> |                 |
| Contents of the<br>first word data | Upper           | 00 <sub>H</sub> |
|                                    | Lower           | 00 <sub>H</sub> |
| Contents of the<br>next word data  | Upper           | 27 <sub>H</sub> |
|                                    | Lower           | 10 <sub>H</sub> |
| CRC data                           | Upper           | D3 <sub>H</sub> |
|                                    | Lower           | 0F <sub>H</sub> |

\* Meaning of read-out data

Low limit of set value      00 00<sub>H</sub> =      0 (= 0.00%FS)

(contents of first word data)

High limit of set value      27 10<sub>H</sub> = 10000 (=100.00%FS)

(contents of next word data)

When input range is 0 to 400°C

Low limit of set value = 0°C (= 0.00%FS)

High limit of set value = 400°C (=100.00%FS)

➤Point➤ For handling of the internal calculation value, engineering unit and decimal point, refer to section 7.1.

(b) In case of data of engineering unit

The following shows an example of reading the low and high limits of set value from No. 2 slave station.

Relative address of low limit set value : 0406<sub>H</sub>

Data number : 02<sub>H</sub>

Command message composition (byte)

|  |                 |                 |
|--|-----------------|-----------------|
| Station No.                              | 02 <sub>H</sub> |                 |
| Function code                            | 03 <sub>H</sub> |                 |
| Read-out start No.<br>(relative address) | Upper           | 04 <sub>H</sub> |
|  | Lower           | 06 <sub>H</sub> |
| Read-out word<br>number                  | Upper           | 00 <sub>H</sub> |
|  | Lower           | 02 <sub>H</sub> |
| CRC data                                 | Upper           | 25 <sub>H</sub> |
|  | Lower           | 09 <sub>H</sub> |

Response message composition (byte)

|                                    |                 |                 |
|------------------------------------|-----------------|-----------------|
| Station No.                        | 02 <sub>H</sub> |                 |
| Function code                      | 03 <sub>H</sub> |                 |
| Read-out byte number               | Upper           | 04 <sub>H</sub> |
|                                    | Lower           | 0H              |
| Contents of the<br>first word data | Upper           | 01 <sub>H</sub> |
|                                    | Lower           | 90 <sub>H</sub> |
| Contents of the<br>next word data  | Upper           | C8 <sub>H</sub> |
|                                    | Lower           | CF <sub>H</sub> |
| CRC data                           |                 |                 |

\* Meaning of read-out data

Low limit of set value                  00  00<sub>H</sub> =        0  
     (contents of first word data)

High limit of set value                  01  90<sub>H</sub> =     400  
     (contents of next word data)

When the position of decimal point is 0 (Parameter P-dP=0),

Low limit of set value = 0°C

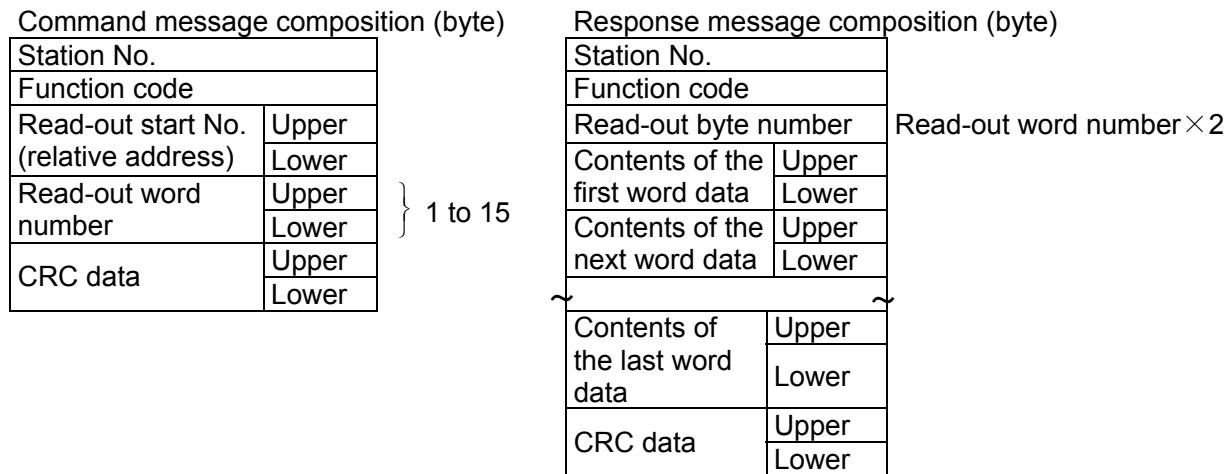

High limit of set value = 400°C

 For handling of the internal calculation value, engineering unit and decimal point, refer to section 7.1.

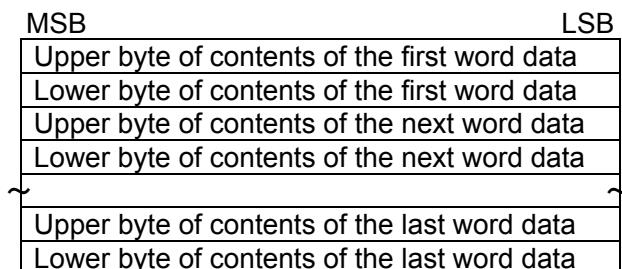

## 6.4 Read-out of Read-out Only Word Data [Function code:04<sub>H</sub>]

| Function code   | Max. word number read-out in one message | Relative data address                | Resister No. | Kind of data               |
|-----------------|--|--------------------------------------|--------------|----------------------------|
| 04 <sub>H</sub> | 15 words                                 | 0000 <sub>H</sub> —000E <sub>H</sub> | 30001—30015  | Internal calculation value |
|                 |  | 03E8 <sub>H</sub> —03F6 <sub>H</sub> | 31001—31015  | Engineering unit           |

### (1) Message composition

\* Arrangement of read-out word data

### (2) Function explanations

Word data of continuous word numbers from the read-out start No. can be read. Read-out word data are transmitted from the slave station in the order of upper and lower bytes.

### (3) Message transmission

#### (a) In case of data of internal calculation value

The following shows an example of reading-out the PV from No. 1 slave station.

Relative address of PV : 0000<sub>H</sub> Data number : 01<sub>H</sub>

Command message composition (byte)

|  |                 |                 |
|--|-----------------|-----------------|
| Station No.                              | 01 <sub>H</sub> |                 |
| Function code                            | 04 <sub>H</sub> |                 |
| Read-out start No.<br>(relative address) | Upper           | 00 <sub>H</sub> |
|  | Lower           | 00 <sub>H</sub> |
| Read-out word<br>number                  | Upper           | 00 <sub>H</sub> |
|  | Lower           | 01 <sub>H</sub> |
| CRC data                                 | Upper           | 31 <sub>H</sub> |
|  | Lower           | CA <sub>H</sub> |

Response message composition (byte)

|                                    |                 |                 |
|------------------------------------|-----------------|-----------------|
| Station No.                        | 01 <sub>H</sub> |                 |
| Function code                      | 04 <sub>H</sub> |                 |
| Read-out byte number               | 02 <sub>H</sub> |                 |
| Contents of the<br>first word data | Upper           | 03 <sub>H</sub> |
|                                    | Lower           | 46 <sub>H</sub> |
| CRC data                           | Upper           | 38 <sub>H</sub> |
|                                    | Lower           | 32 <sub>H</sub> |

\* Meaning of read-out data

Contents of the first word data 03 46<sub>H</sub> = 838 (=8.38%FS)

When input range is 0-400°C,

PV=33.5°C (=8.38%FS × 400)

Input range

#### (b) In case of data of engineering unit

The following shows an example of reading-out the PV value from No. 1 slave station.

Relative address of PV value : 03E8<sub>H</sub> Data number : 01<sub>H</sub>

Command message composition (byte)

|  |                 |                 |
|--|-----------------|-----------------|
| Station No.                              | 01 <sub>H</sub> |                 |
| Function code                            | 04 <sub>H</sub> |                 |
| Read-out start No.<br>(relative address) | Upper           | 03 <sub>H</sub> |
|  | Lower           | E8 <sub>H</sub> |
| Read-out word<br>number                  | Upper           | 00 <sub>H</sub> |
|  | Lower           | 01 <sub>H</sub> |
| CRC data                                 | Upper           | B1 <sub>H</sub> |
|  | Lower           | BA <sub>H</sub> |

Response message composition (byte)

|                                    |                 |                 |
|------------------------------------|-----------------|-----------------|
| Station No.                        | 01 <sub>H</sub> |                 |
| Function code                      | 04 <sub>H</sub> |                 |
| Read-out byte number               | 02 <sub>H</sub> |                 |
| Contents of the<br>first word data | Upper           | 01 <sub>H</sub> |
|                                    | Lower           | 4F <sub>H</sub> |
| CRC data                           | Upper           | 38 <sub>H</sub> |
|                                    | Lower           | 32 <sub>H</sub> |

\* Meaning of read-out data

Contents of the first word data 01 4F<sub>H</sub> = 335

When the position of decimal point is 1 (Parameter P-dP=1),

PV=33.5°C (=33.5)

**Point** For handling of the internal calculation value, engineering unit and decimal point, refer to section 7.1.

## 6.5 Write-in of Bit Data (1 bit) [Function code:05<sub>H</sub>]

| Function code   | Max. bit number written-in one message | Relative data address | Coil No. |
|-----------------|--|-----------------------|----------|
| 05 <sub>H</sub> | 1 bit                                  | 0000 <sub>H</sub>     | 00001    |

This function has become unnecessary. (The customer can continue using the controller without changing the program.)

### (1) Message composition

| Command message composition (byte)           |                 | Response message composition (byte)          |                 |
|--|-----------------|--|-----------------|
| Station No.                                  |                 | Station No.                                  |                 |
| Function code                                |                 | Function code                                |                 |
| Write-in designate No.<br>(relative address) | 00 <sub>H</sub> | Write-in designate No.<br>(relative address) | 00 <sub>H</sub> |
|  | 00 <sub>H</sub> |  | 00 <sub>H</sub> |
| State of write-in designation                | Upper           | State of write-in designation                | Upper           |
|  | Lower           |  | Lower           |

|  | Lower           |  | Lower           |

} 0000<sub>H</sub>=0  
FF00<sub>H</sub>=1

} 0000<sub>H</sub>=0  
FF00<sub>H</sub>=1

### (2) Function explanations

Data of "0" or "1" is written in a bit of write-in designation No. bit. When "0" is written-in data of 0000<sub>H</sub> is transmitted, and when "1" is written-in, data of FF00<sub>H</sub> is transmitted.

### (3) Message transmission (example:This is the method of FIX execution)

The following shows an example of FIX execution request to No. 1 slave station.

FIX execution request bit    Relative address : 0000<sub>H</sub>

| Command message composition (byte)           |                          | Response message composition (byte)          |                          |
|--|--------------------------|--|--------------------------|
| Station No.                                  |                          | Station No.                                  |                          |
| Function code                                |                          | Function code                                |                          |
| Write-in designate No.<br>(relative address) | Upper    00 <sub>H</sub> | Write-in designate No.<br>(relative address) | Upper    00 <sub>H</sub> |
|  | Lower    00 <sub>H</sub> |  | Lower    00 <sub>H</sub> |
| State of write-in designation                | Upper    FF <sub>H</sub> | State of write-in designation                | Upper    FF <sub>H</sub> |
|  | Lower    00 <sub>H</sub> |  | Lower    00 <sub>H</sub> |
| CRC data                                     | Upper    8C <sub>H</sub> | CRC data                                     | Upper    8C <sub>H</sub> |
|  | Lower    3A <sub>H</sub> |  | Lower    3A <sub>H</sub> |

After receiving above command, it takes approximately 100ms to 5s seconds that PXR saves memory data from RAM to EEPROM.

#### Caution

If you turn off the PXR during above saving (approximately 100ms to 5s), memory data are broken and can not be used.

➤Point➤ For details of FIX processing, refer to section 5.7.

## 6.6 Write-in of Word Data (1 word) [Function code:06<sub>H</sub>]

| Function code   | Max. word number write-in<br>in one message | Relative data address                | Resister No. | Kind of data               |
|-----------------|---|--------------------------------------|--------------|----------------------------|
| 06 <sub>H</sub> | 1 words                                     | 0000 <sub>H</sub> —0070 <sub>H</sub> | 40001—40113  | Internal calculation value |
|                 |   | 03E8 <sub>H</sub> —0458 <sub>H</sub> | 41001—41113  | Engineering unit           |

### (1) Message composition

| Command message composition (byte)              |       | Response message composition (byte)             |       |
|---|-------|---|-------|
| Station No.                                     |       | Station No.                                     |       |
| Function code                                   |       | Function code                                   |       |
| Write-in<br>designate No.<br>(relative address) | Upper | Write-in<br>designate No.<br>(relative address) | Upper |
|   | Lower |   | Lower |
| Write-in word<br>data                           | Upper | Write-in word<br>data                           | Upper |
|   | Lower |   | Lower |
| CRC data  | Upper | CRC data  | Upper |
|   | Lower |   | Lower |

### (2) Function explanation

Designated word data is written in write-in designate No. Write-in data are transmitted from master station in the order of upper and lower bytes.

### (3) Message transmission (example)

The following shows an example of setting 100.0 (10000=C3E8<sub>H</sub>) to the parameter "P" of No.1 slave station.

Parameter "P" Relative address: 0005<sub>H</sub> (table of internal calculation unit)

(or 03ED<sub>H</sub> (table of engineering value))

\* Parameter "P" is not in the engineering unit setting, the same value is written in both tables.

| Command message composition (byte)              |                 |                 | Response message composition (byte)             |                 |                 |
|---|-----------------|-----------------|---|-----------------|-----------------|
| Station No.                                     | 01 <sub>H</sub> |                 | Station No.                                     | 01 <sub>H</sub> |                 |
| Function code                                   | 06 <sub>H</sub> |                 | Function code                                   | 06 <sub>H</sub> |                 |
| Write-in<br>designate No.<br>(relative address) | Upper           | 00 <sub>H</sub> | Write-in<br>designate No.<br>(relative address) | Upper           | 00 <sub>H</sub> |
|   | Lower           | 05 <sub>H</sub> |   | Lower           | 05 <sub>H</sub> |
| State of write-in<br>designation                | Upper           | 03 <sub>H</sub> | State of write-in<br>designation                | Upper           | 03 <sub>H</sub> |
|   | Lower           | E8 <sub>H</sub> |   | Lower           | E8 <sub>H</sub> |
| CRC data  | Upper           | 99 <sub>H</sub> | CRC data  | Upper           | 99 <sub>H</sub> |
|   | Lower           | 75 <sub>H</sub> |   | Lower           | 75 <sub>H</sub> |

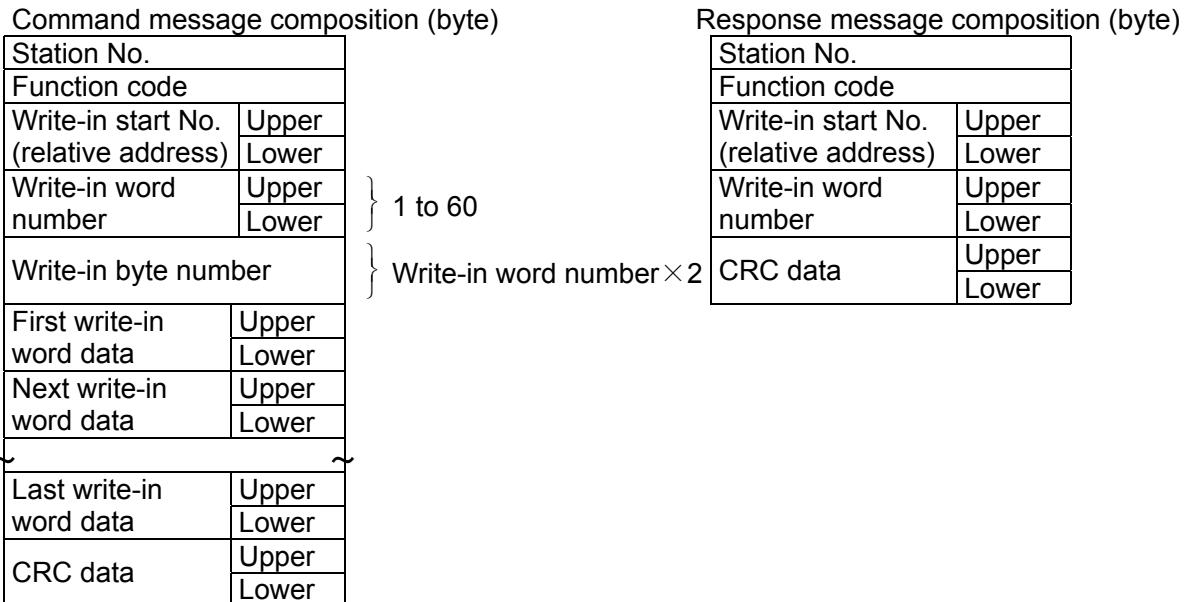

In case of  
interval  
calculation  
value

- Point** For handling of internal calculation value, engineering unit and decimal point, refer to section 7.1.
- Note!**
- 1)While setting is being locked, response is returned normally, but the command is not executed.
  - 2)While the data is written in non-volatile memory, response is not returned.

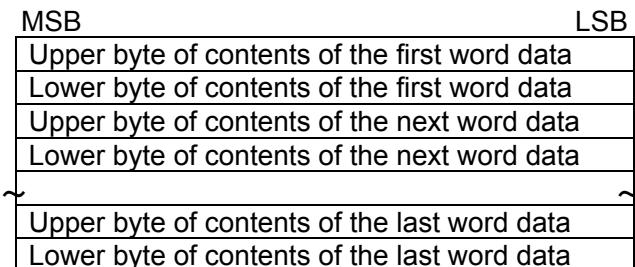

## 6.7 Write-in of Continuous Word Data [Function code:10<sub>H</sub>]

| Function code   | Max. word number write-in in one message | Relative data address                | Resister No. | Kind of data               |
|-----------------|--|--------------------------------------|--------------|----------------------------|
| 10 <sub>H</sub> | 60 words                                 | 0000 <sub>H</sub> —0070 <sub>H</sub> | 40001—40113  | Internal calculation value |
|                 |  | 03E8 <sub>H</sub> —0458 <sub>H</sub> | 41001—41113  | Engineering unit           |

### (1) Message composition

\* Arrangement of write-in word data

### (2) Function explanation

Word data of continuous word number is written from write-in start address. Write-in word data are transmitted from master station in the order of upper and lower bytes.

### (3) Message transmission (example)

The following shows an example of writing-in P=100.0, I=10, and D=5.0 to No. 1 slave station.

P=03E8<sub>H</sub> (=1000<sub>D</sub>)

I=0064<sub>H</sub> (=100<sub>D</sub>)

D=0032<sub>H</sub> (=50<sub>D</sub>)

Parameter "P" Relative address:0005<sub>H</sub> Data number:03<sub>H</sub>

Command message composition (byte)

|                          |                 |                 |
|--------------------------|-----------------|-----------------|
| Station No.              | 01 <sub>H</sub> |                 |
| Function code            | 10 <sub>H</sub> |                 |
| Write-in start No.       | Upper           | 00 <sub>H</sub> |
|                          | Lower           | 05 <sub>H</sub> |
| Write-in word number     | Upper           | 00 <sub>H</sub> |
|                          | Lower           | 03 <sub>H</sub> |
| Write-in byte number     | 06 <sub>H</sub> |                 |
| First write-in word data | Upper           | 03 <sub>H</sub> |
|                          | Lower           | E8 <sub>H</sub> |
| Next write-in word data  | Upper           | 00 <sub>H</sub> |
|                          | Lower           | 64 <sub>H</sub> |
| Last write-in word data  | Upper           | 00 <sub>H</sub> |
|                          | Lower           | 32 <sub>H</sub> |
| CRC data                 | Upper           | 56 <sub>H</sub> |
|                          | Lower           | BE <sub>H</sub> |

Response message composition (byte)

|                      |                 |                 |
|----------------------|-----------------|-----------------|
| Station No.          | 01 <sub>H</sub> |                 |
| Function code        | 10 <sub>H</sub> |                 |
| Write-in start No.   | Upper           | 00 <sub>H</sub> |
|                      | Lower           | 05 <sub>H</sub> |
| Write-in word number | Upper           | 00 <sub>H</sub> |
|                      | Lower           | 03 <sub>H</sub> |
| CRC data             | Upper           | 90 <sub>H</sub> |
|                      | Lower           | 09 <sub>H</sub> |

➤Point Since the transmission data can not include a decimal point, data of 100.0 is transmitted as "1000".

For transmission format of each data, refer to the address map (Chapter 7).

# 7. ADDRESS MAP AND DATA FORMAT

## 7.1 Data Format

### 7.1.1 Transmission data format

The MODBUS protocol used in this instrument (PXR) is RTU (Remote Terminal Unit) mode.

Transmitted data is "numeric value" and not "ASCII code".

### 7.1.2 Internal calculation value and engineering unit

This instrument can handle 2 kinds of set value data or other data which are affected by input range as follows.

- 1) Internal calculation value : In % with respect to input range (0.00 to 100.00, without decimal point)
- 2) Engineering unit : Subjected to scaling to actual value according to input range

"Engineering unit" data can be handled with "Internal calculation value" address (register No.) plus 1,000

[Example] The value of "PV = 150" (input range: 0 to 400°C)

|                            | Register No. | Data (HEX) | → | Data (decimal) |
|----------------------------|--------------|------------|---|----------------|
| Internal calculation value | 30001        | 0EA6H      |   | 3750 (37.50%)  |
| Engineering unit           | 31001        | 0096H      |   | 150            |

In case of "Internal calculation value" here,

$$37.50\% \times 400\text{ (full scale)} = 150\text{ (}^{\circ}\text{C)}$$
 is obtained.

Note that the same data is handled at both addresses if it is not affected by input range.

This handling does not apply to bit data. (Address increased by 1,000 is invalid.)

For data affected by input range, refer to address maps in Sections 7.2 and 7.3.

Note : After changing the input range by communication write-in, pay attention to the decimal point position.

After changing the decimal point position by communication write-in, simultaneously change the lower limit and upper limit of input range.

Example: Input range 0 to 400 changed into 0.0 to 400.0

- a) Face panel operation: P-dP=0→1 suffices
- b) Communication write-in: P-dP=0→1  
P-SL=0→0  
P-SU=400→4000 } must be performed.

### 7.1.3 Handling of decimal point

Some internally stored data have more digits below decimal point than displayed on the face panel.

No decimal point is added to transmission data.

For data given in the following table, carry out an alignment of decimal point.

- (a) Internal calculation value data (address map shown in Section 7.2)

| Digits below point                     | Kind                         | Register No.                  |
|--|------------------------------|-------------------------------|
| Designate by parameter [P-dP] (0 to 2) | Parameter [ P-SL ]           | 40018                         |
|  | Parameter [ P-SU ]           | 40019                         |
| 1 digit below point                    | Parameter [ P ]              | 40006                         |
|  | Parameter [ i ]              | 40007                         |
|  | Parameter [ d ]              | 40008                         |
|  | Parameter [ CooL ]           | 40010                         |
|  | Parameter [ P-dF ]           | 40022                         |
|  | Parameter [ HB ]             | 40039                         |
|  | Parameter [ CT ]             | 30010                         |
| 2 digits below point                   | Data affected by input range | See address map (Section 7.2) |
|  | Parameter [ dB ]             | 40011                         |
|  | Parameter [ bAL ]            | 40013                         |
|  | Parameter [ PLC1 ]           | 40025                         |

|  | Parameter [ HB ]             | 41039                         |
|  | Parameter [ CT ]             | 31010                         |
| 2 digits below point                   | Parameter [ dB ]             | 41011                         |
|  | Parameter [ bAL ]            | 41013                         |
|  | Parameter [ PLC1 ]           | 41025                         |
|  | Parameter [ PHC1 ]           | 41026                         |
|  | Parameter [ PLC2 ]           | 41027                         |
|  | Parameter [ PHC2 ]           | 41028                         |
|  | Parameter [ OUT1 ]           | 31004                         |
|  | Parameter [ OUT2 ]           | 31005                         |

#### 7.1.4 Data when input is abnormal

When "UUUU" or "LLLL" is displayed on the face panel on account of over-range, under-range or input open-circuit for example, PV read-out value is 105% or -5% of input range.

Presence of any input abnormality via communication can be detected by:

"Register No. 30008 (or 31008): Input/main unit abnormal status"

## 7.2 Address Map of Internal Calculation Value Data

Data affected by input range is handled in terms of internal value (0.00 to 100.00% value) before scaling.

For detailed contents about individual parameter function or setting range, refer to the operation manual (ECNO: 406).

Bit data [read-out/write-in] : Function code [01<sub>H</sub>, 05<sub>H</sub>]

| Relative address  | Coil No. | Type | Memory contents                              | Read-out data                           | Write-in data setting range           | Affected by input range | Remarks or corresponding parameter |
|-------------------|----------|------|--|---|---------------------------------------|-------------------------|------------------------------------|

Notes)

- For details of \* ② to \* ⑥ in the table, refer to Section 7.4.
- The area marked (Do not use) is a reserve area. Do not write in there.
- Register numbers 30002 (currently used SV) and 40003 (face panel set SV) do not become the same value while switching-SV is active or ramp/soak is under way. (Example: While SV-1 is selected, the value of SV-1 is read out of register number 30002.) For reading out SV for monitoring, use SV in register number 30002.

## 7.3 Address Map of Engineering Unit Data

Data affected by input range is handled in terms of a value (engineering unit) after scaling.

For detailed contents about individual parameter function or setting range, refer to the operation manual (ECNO: 406).

Bit data [read-out/write-in] : Function code [01<sub>H</sub>, 05<sub>H</sub>]

| Relative address  | Coil No. | Type | Memory contents                              | Read-out data                           | Write-in data setting range        | Affected by input range | Remarks or corresponding parameter |
|-------------------|----------|------|--|---|------------------------------------|-------------------------|------------------------------------|
| 0000 <sub>H</sub> | 00001    | Bit  | Write in non-volatile memory (FIX execution) | 0:Not Writing-in<br>1:Writing in memory | 0:No request<br>1:Write-in request |                         | (the same function as 40001)       |

Bit data [read-out only] : Function code [02<sub>H</sub>]

Notes)

- For details of \* ② to \* ⑥ in the table, refer to Section 7.4.
- The area marked (Do not use) is a reserve area. Do not write in there.
- Register numbers 31002 (currently used SV) and 41003 (face panel set SV) do not become the same value while switching-SV is active or ramp/soak is under way. (Example: While SV-1 is selected, the value of SV-1 is read out of register number 31002.) For reading out SV for monitoring, use SV in register number 31002.

## 7.4 Additional Explanation of Address Map

- \*② Register number 40087, 41087 (read-out/write-in area)

Contents of the communication DI action

Used for requesting a DI action via communication. Once written in, the contents remain held unless the power is turned off or another value is written in. Pay attention to this point particularly when canceling the alarm latching.

Read-out data is the data which was written in via communication and is different from hardware DI action request data (see \* ⑤). Do not doubly request the action of the same function as hardware DI.

| Bit    | Contents                       | Read-out   |     | Write-in                             |                                  |

| 17            | End                            | End status of ramp/soak   |

## 8. SAMPLE PROGRAM

This section concerns data read-out/write-in sample program by GW-BASIC<sup>\*1</sup> which operated on Windows 95<sup>\*1</sup> MS-DOS<sup>\*1</sup> PROMPT.

Note that the program shown here is for reference for you to create a program and not for guaranteeing all actions.

Before executing the program, make sure of the communication conditions in the following procedure.

- Communication speed (baud rate), data length, stop bits and parity bit

Set in this program. Match the conditions with this instrument.

Note) Cautions on using SEKISUI's RS232C and RS485 converter unit (SI-30A)

In SI-30A, send data are received, added to start of the answer data from the slave station. After cleared data corresponding to the number of sending bytes, treat the remaining data as the answer data in the data receiving process.

\*1: GW-BASIC, Windows 95 and MS-DOS are registered trademarks of Microsoft Corporation.

(a) Example of data read-out

Operation:Read-out PV, SV (currently used), DV and MV (control output 1) at a time.

(Continuous word read-out from read-out only area)

Used function code : 04H

Read-out start register No. : 31001 (Engineering unit data)

Read-out word number : 4

## 9. TROUBLESHOOTING

If the communication is unavailable, check the following items.

- Whether all devices related to communication are turned on.
- Whether connections are correct.
- Whether the number of connected instruments and connection distance are as specified
- Whether communication conditions coincide between the master station (host computer) and slave stations (PXR)
  - Transmission speed : 9600bps
  - Data length : 8 bits
  - Stop bit : 1 bit
  - Parity :  odd
    - even
    - none
- Whether send/receive signal timing conforms to Section 5.4 in this manual.
- Whether the station No. designated as send destination by the master station coincides with the station No. of the connected PXR
- Whether more than one instrument connected on the same transmission line shares the same station No.
- Whether the station No. of instruments is set at other than 0.  
If it's 0, the communication function does not work.
- Whether the 11th digit of type cord of this controller is M or V?

(PXR4□□□□-□□<sup>M</sup><sub>V</sub>□□-□)
